

Junior Internet - Twoja droga do sukcesu

Tomasz Delikat – JuniorText – Temat: Edukacja przez Internet

Education via the Internet

Education through the Internet gradually spreads all over the world. Thirty years ago hardly anybody would think about such a powerful tool. There is a completely new and giant world just one click away. Following that one contented his or her virtual world. We can do shopping via the Internet, we can play games, we can meet new people and date, we can buy holidays, cars or homes, we can control our bank account and we can pay our taxes using the Internet. We can do almost everything through the internet so why don't one educate using this hyper textual embedding? There's even something called e-learning which is learning with utilization of the Internet and computer techniques. As we can see, it is a very interesting and popular issue so one should take a closer look.

Who is this form of education assigned for? In one word or two: for everyone. There are websites for every kind of students: primary school, secondary, high school. Special courses especially dedicated to comprise the following domains such as law, engineering or photography. There are as many directions as many people. Using the Internet you can attend courses which are unattainable in a traditional way. That is one of the main causes why people are choosing this kind of education. And it is cheaper, sometimes even for free. As we can see, there are a lot of advantages – these of financial side are no exception. True virtual learning is not a mere slogan.

The quality of virtual learning improved by modern solutions develops well and every year it is getting bigger and more powerful. It means that people not only use it more and more often but also more effectively. Many people who completed an Internet course use knowledge which they have earned and they make money in their dreamed job. Having met the above assumptions one can conscientiously earn really solid knowledge that enables you to work as a specialist. Best results are achieved due to hard work and regular attendance. Of course there are many websites offering education which simply gives you nothing. Using the Internet one has to be very cautious. It is a new world for real. Circling round the world, the Internet is also present in third world countries. The whole idea of virtual learning slowly begins to work in countries such as Ghana or Nigeria. Quite a relevant information about the contemporary Internet status quo can be read, for example, in: Introducing pedagogy-supporting technology in higher education in Ghana requires rethinking institutional policies and lining up stakeholder support written by Isaiah T. Awidi in 2008.

There are many organisations (such as: <http://orgs.tigweb.org/ghana-computer-charity>) which help African children to be more familiar with the Internet and computer early steps – metaphorically – with computer 'abc'. It is really noble idea which we all should support - the idea that is frequently "the only window" for outer world.

Summing up, education via the Internet is a fact. People use it and it develops really quickly. Looking at various angles the Internet has its bright and dark sides. In modern times it is

Junior Internet - Twoja droga do sukcesu

getting normal that someone has completed the Internet course and now he or she is a specialist in his or her profession . Summing it all up virtual learning is part of our future .Maybe in fifty years traditional schools will not exist? Only time can show it but one thing is certain – changes are coming.
